

1

ABSTRACT OF THE DISCLOSURE

2 An apparatus that mass polishes a variety of fiber optic cable connectors simultaneously.

3 The apparatus includes a plurality of polishing plates, each capable of holding its own polishing film

4 and pad, and having a varying height. The apparatus further includes a plurality of connector

5 fixtures that may receive a variety of connectors at varying angles. Each connector fixture

6 communicates with a corresponding polishing pad. Thus, fiber optic cable connectors having a

7 variety of polished end faces may be provided with the apparatus. The apparatus also eliminates the

8 potential for contamination among polishing films, reduces polishing steps, and saves labor and

9 maintenance costs.
